Aptos (APT) Tokenomics Explained: Time to Buy Aptos?

Original:

<https://www.btcc.com/en-US/academy/research-analysis/aptos-apt-tokenomics-explained-time-to-buy-aptos>

With MOVE as its primary programming language, [Aptos](#) is a layer 1 [blockchain](#) solution that is both highly modular and simple to update. There are a number of enhancements to the protocol that work together to enhance both the user experience and the security of the system. For instance, hybrid important management systems improve security and lessen the likelihood of key mishandling, and pre-signing transaction transparency clarifies the conclusion of a transaction before the user signs it.

Aptos (APT) Whitepaper

The Aptos whitepaper covers a lot of ground when it comes to the nuts and bolts of how the blockchain works. One of the highlights is:

- Aptos uses a Rust-based programming language called Move and a BFT PoS consensus.
- Aptos uses parallel execution so that numerous transactions can be processed at once.
- According to Aptos, it is currently capable of 130,000 transactions per second (TPS) while still being secure and dependable. At least 160,000 is needed.
- Costs associated with retrieving and editing data in Aptos are essentially constant.
- Large datasets can be stored in tables on the blockchain, and users can choose to have their accounts be shared or private.

Aptos (APT) Tokenomics

Like many other blockchains, Aptos uses a native coin for staking, voting on governance, and paying for access to the network. There has been no token distribution as of yet. The Aptos blockchain tokenomics framework has been released by the Aptos Foundation. According to the tweets, the foundation has only offered a brief overview of the blockchain's tokenomics and fundamentals but has promised a more thorough explanation in the near future.

Initially there will be 1 billion tokens on the blockchain, but by the end of 2031, that number will have increased to 1.5 billion. Octas will be Aptos's smallest unit. On the blockchain, the community will own around 51%, core contributors about 19%, the foundation about 16.5%, and investors about 13.48%. Over the next decade, the community will receive grants and participate in other programs funded by the money. Investor and key contributor tokens are subject to a four-year vesting period.

Category	% of Initial Token Distribution	Initial Tokens
Community	51.02%	510,217,359.767
Core Contributors	19.00%	190,000,000.000
Foundation	16.50%	165,000,000.000
Investors	13.48%	134,782,640.233

In addition, according to the foundation, 82% of network tokens have been staked and are currently earning staking payments. Users should be able to access and trade their staking rewards, regardless of any vesting periods that may apply. The community will get the funds through a variety of grant and other programs throughout the next decade. The token vesting time for key

contributors and investors is four years.

An Analysis of Aptos Tokenomics by Crypto Professionals

Some industry analysts believe that Aptos (APT) is unfairly dominated by whales, despite the fact that it has quickly been known as one of the most overhyped projects of the upcoming Crypto Winter. The fact that 82% of APT tokens are staked has garnered attention, indicating that a sizable quantity of APT can be sold to retail customers. A number of cryptocurrency users have expressed concern that trading of the blockchain's token will commence prior to the publishing of the tokenomics description. Many skeptics also found amusement in the fact that 51% of APT tokens were allocated at random to the "community." Finally, critics applauded the fact that major trading platforms like Binance and FTX included APT in spot pairs on day one, since this served as a warning of the extreme volatility they expected to encounter.
