## Terra (LUNA) Price Forecast: Will LUNA Regain Its Priority in the Market?

Original:

<https://www.btcc.com/en-US/academy/research-analysis/terra-luna-price-prediction-will-luna-regain-its-priority-in-the-market>

### Terra (LUNA): A Pragmatic Viewpoint

Before we get into the Terra price prediction, it's important to note that [LUNA](#) is a departure from the traditional cryptocurrencies of today because it is a decentralized financial payment network that replaces the traditional payment stack on the blockchain. Stable coins tied to fiat currencies are used to power global payment networks on Terra.

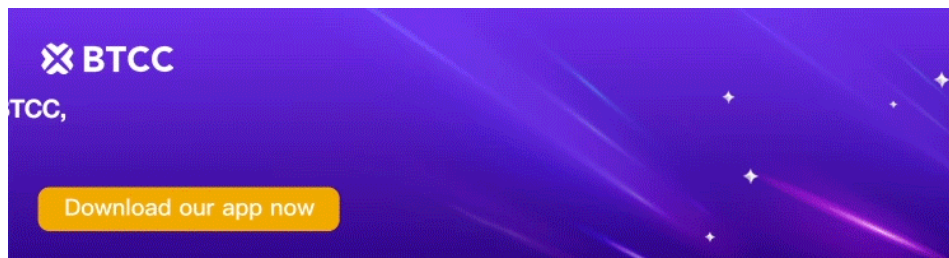

Terra's special feature (LUNA) is a driving force in eliminating the barrier to entry into token mining. By doing away with middlemen and permission requests, it helps increase openness. In contrast to Bitcoin and other individual cryptocurrencies, Terra's native token LUNA is more akin to a programmable asset that solves problems of latency, scalability, and accessibility. Let's learn about the Future Terra (LUNA) Price Prediction.

**Terra:** [Stablecoins](#) pegged to the value of fiat currencies. Users produce fresh Terra by consuming LUNA. Stablecoins are named for their corresponding fiat currencies. For instance, the Terra stablecoin tracks the price of the IMF's SDR, which it calls TerraSDR or SDT. Other stablecoins are [TerraUSD](#) or [UST](#), TerraKRW or KRT, and TerraUSD or UST.

**LUNA:** Terra's native staking token, LUNA, absorbs the price fluctuation of Terra. LUNA is used for administration and mining. In exchange for transaction fees, users stake LUNA to validators who record and validate transactions on the blockchain. The greater Terra's utilization, the greater LUNA's value.

**UST:** UST is an algorithmic stablecoin whose stability is inversely proportional to the price of LUNA. If UST loses its \$1 peg, UST is destroyed and new LUNA coins are produced. And if UST appreciates significantly, LUNA coins are burned and new UST coins are produced. Therefore, each price maintains the value of the other. When \$285 million worth of UST was liquidated on Curve and Binance, chaos ensued.

For the purpose of stabilizing the UST peg, Terraform Labs liquidated all of its 40,000 BTC holdings. This resulted in an enormous crypto crash. Moreover, both the LUNA price and the UST began dramatically correcting. UST lost its peg and new LUNA coins were issued, which had a significant impact on its pricing. Also a popular lending procedure, Anchor had massive ANC withdrawals due to its 20% yield on UST deposits.

## The Future of LUNA and UST

After the massive decline in Terra's worth, most people had only one question: "Can Terra's value rise again?" or "Will Earth ever recover?" Do Kwon, the CEO of Terralabs, offered a plan to revitalize LUNA. He believes he has a solution to this problem by splitting Terra Blockchain. The new blockchain would be established alongside one billion LUNA tokens, which would be given to existing LUNA and UST holders and used to fund the creation of new Terra applications.

The initiative requires LUNA owner approval, with a vote slated for Wednesday. If the proposal is approved, the current Terra blockchain would be renamed Terra Classic, while the new chain will simply be known as Terra.

## Terra (LUNA) Price Estimates for 2022-2025

The one positive aspect of the current market environment is that currencies have not been discriminated against. The majority of fiat currencies and cryptocurrencies have met with the same terrible end. In contrast to other financial markets, however, cryptocurrencies recovered quickly. Many investors are still anticipating the fight of the titans, pondering whether or not it is worthwhile to invest in cryptocurrencies.

However, the fate of Terra (LUNA) is the worst of all. To prevent governance assaults, the biggest cryptocurrency exchanges had temporarily blocked LUNA withdrawals, and the Terra blockchain had ceased operations. Do Kwon, the token's founder, chose to resurrect it after its precipitous price decline.

With his strategy for revitalization, he proposed a new hard fork that would assist in the correction of such design defects in the ecosystem. The new blockchain has already been introduced, and its predecessor has been renamed Terra Classic (LUNC). However, it remains unclear whether these actions will restore the LUNA environment.

This new token began trading at a price of about \$4.8 and peaked at \$19.54, which is also its ATH. Unfortunately, after reaching ATH, the Terra's price dropped by about 99 percent in a single day. The price of the coin remained on an upswing for three days, but it was unable to surpass \$10.7 again. However, the currency was unable to sustain the rally for even a week, and LUNA immediately began trading in a decline.

Current Terra (LUNA) price is approximately \$3.42 with a market cap of \$708,726,168, a supply of 210,000,000.00 LUNA, and a 24-hour trading volume of \$346,074,334. Many traders and investors have lost faith as a result of the recent LUNA price drop, but many believe that the new blockchain

will help Terra's price recover shortly. Consider the Terra price forecast over the coming years.
